

GATEWAY SHOPPING CENTER

CHALLENGE: The Gateway Shopping development is a 240,000 sq.ft. outdoor mall project. It required a pavement, parking area that could handle the vehicular traffic, rapid stormwater infiltration, and lower maintenance cycles.

SOLUTION: Eco-Optiloc was the chosen paver because the shape provides tremendous strength relative to the forces exerted by vehicular traffic. With its 12mm wide void opening, it facilitates rapid water infiltration while extending its service intervals, all while remaining ADA compliant. Eco-Optiloc has a rather wide void opening compared to others in the market. The wider the gap, the more stone in the void, the more surface area to clean water, the longer the service interval between cleanings. Installers used specialized equipment to lay the paver with astonishing efficiency, which lowers the labor significantly. Eco-Optiloc can be laid in excess of 10,000 square feet in one day!
